

Credit Name: CSE 2140 2nd Language Programming
Assignment Name: Chapter 3 Mastery Exercise 5 (Change)

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

The IPO chart was the main thing that helped me understand the what I needed to ask the user, what to calculate, and how to present the information.

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

I wasn't totally sure how to use integer division and modulus division so I had to reference my textbook.

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

I broke it down into the input, calculating the minimum number of each coin, adding up the total coins, and then presenting the output.

How did you decide on the tools, data structures, or algorithms to use?

The data input and calculations were all just using natural numbers of small decimals so my use of floats and integers reflected that. Other algorithms were based on either the skill builders or previous coding experience.

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

In this case I tested small parts of code before I got too far along. This gave me the opportunity to make quick fixes if needed without entirely rewriting my code.

How did you test your solution along the way to make sure it was working?

I would run a few lines of test code to see if I was on the right track. For example, calculating the amount of quarters in \$0.75

Overcoming Challenges

What part of the problem was the most difficult for you?

I found it fairly straightforward other than making sure I was doing my calculations (different types of division) correctly.

How did you handle moments when you felt stuck or unsure of what to do next?

I used the resources around me such as the textbook, google and friends.

Learning

Was there anything you learned that you think will help you with future challenges?

I think I have a better understanding of how to use basic arithmetic operators in java which is definitely a skill that will help with future codes.
