

Credit Name: CSE 2140 2nd Language Programming
Assignment Name: Chapter 3 Mastery Exercise 1 (ObjectHeight)

Error Log Entry

What error message did you encounter (if any)?

Type mismatch: cannot convert from double to float

What unexpected behavior did your program exhibit?

It did not allow for a float

What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)

Compile-time type mismatch error

Include a screenshot of specific lines of code.

```
1 package Mastery;
2
3 import java.util.Scanner;
4
5 public class Exercise1 {
6
7     public static void main(String[] args) {
8
9         //Declare Variables
10        float t;
11        float x;
12        float h;
13
14        //Create a Scanner object
15        Scanner userInput = new Scanner(System.in);
16
17        //Ask the user to enter the time
18        System.out.print("Please enter a time less than 4.5s: ");
19
20        //Get the grade from the user
21        t = userInput.nextInt();
22
23        //Calculate t^2 first and then the height based on the given t:
24        x = t*t;
25        h = 100-4.9*x;
26
27        //Display the height for the user
28        System.out.println("The height of the object is: " + h);
29
30    }
31 }
32
33
```

How did you fix the issue?

I added an "f" next to -4.9 to explicitly treat it as a float. I also realized that I failed to specify that the variable "t" could be input by the user as a float so I changed "Int" to "Float".

Provide the corrected code or solution using a screenshot.

```
35 //Get the grade from the user
36 t = userInput.nextFloat();
37
38 //Calculate t^2 first and then the height based on the given t:
39 x = t*t;
40 h = 100-4.9f*x;
41
42 //Display the height for the user
43 System.out.println("The height of the object is: " + h);
44
45 }
```

```
38 //Calculate t^2 first and then the height based on the given time
39 x = t*t;
40 h = 100 -4.9f*x;
```
