

Credit Name: CSE 2140 2nd Language Programming

Assignment Name: Chapter 3 Mastery Exercise 1 (ObjectHeight)

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

I did the IPO chart first which helped me visualize what I had to ask from the user, what the code had to be able to calculate, and what I had to display for the user at the end.

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

I wasn't sure how to square a variable so I just used multiplication. I think it was the easiest way but I also understand that I could have used "Math.pow()"

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

Creating an IPO chart helped me break the coding into 3 parts (input, process, output)

How did you decide on the tools, data structures, or algorithms to use?

Based on my experience in the skill builders, I applied the same knowledge and it seemed straight forward, so I figured it was the most efficient way.

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

I wrote out the entire code (which was pretty short) and then went back and then fixed the lines where I went wrong.

How did you test your solution along the way to make sure it was working?

Yes, I ran regular tests to find my errors, understand what needed improving and see if my fixes had worked.

Overcoming Challenges

What part of the problem was the most difficult for you?

I understood where I went wrong but I wasn't always sure of the best fix.

How did you handle moments when you felt stuck or unsure of what to do next?

I would ask my friends if they understood where I went wrong or just do a bit of research on google.

Learning

Was there anything you learned that you think will help you with future challenges?

Really everything I learned will benefit me in some way with future work. Ex: naming variables, squaring variable, classifying as floats or ints...
