

Error Log Entry

What error message did you encounter (if any)?

java.util.InputMismatchException

What unexpected behavior did your program exhibit?

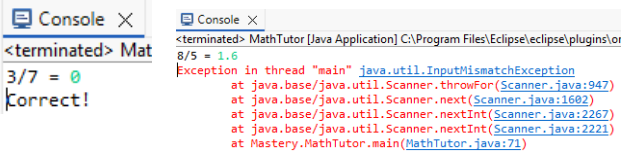

The equations with division rarely worked out to integers. The questions would have been extremely difficult even if decimals were accepted, but java kept rounding the answers. Making it difficult to understand and answer correctly.

What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)

A logic error because the division often produced a decimal answer (that was usually unfindable for the average person), but the program uses nextInt() to read the users answer. This caused a InputMismatchException.

Include a screenshot of specific lines of code.

```
54 else {
55
56     symbol = "/";
57     answer = num1 / num2;
```

The screenshot shows two windows from the Eclipse IDE. The left window is a code editor showing lines 54 to 57 of a Java program. Line 54 is 'else {', line 55 is empty, line 56 is 'symbol = "/";', and line 57 is 'answer = num1 / num2;'. The right window is the 'Console' view. It shows the program has terminated with the message '<terminated> MathTutor [Java Application] C:\Program Files\Eclipse\eclipse\plugins\or'. Below this, it shows the calculation '8/5 = 1.6' and then '3/7 = 0'. The output 'correct!' is visible. A red error message is also present: 'Exception in thread "main" java.util.InputMismatchException' followed by a stack trace starting with 'at java.base/java.util.Scanner.throwFor(Scanner.java:947)'.

How did you fix the issue?

I used a while loop that kept generating a new num2 until num1 could evenly be divided by num2 (without a remainder). Now, every answer is an integer

Provide the corrected code or solution using a screenshot.

```
54 else {
55
56     symbol = "/";
57
58     //Change num2 until it can divide num1 evenly (remainder = 0)
59     while (num1 % num2 != 0) {
60         num2 = random.nextInt(10) + 1;
61     }
62
63     answer = num1 / num2;
64
65 }
```
